5.2 Earthquakes

Video: Earthquakes (Edpuzzle Original)

What Are Earthquakes?

A _____ is a giant ball inside a building that protects it by absorbing vibrations from earthquakes.

Earthquakes are natural _____ where the ground shakes.

Any break in the crust is called a _____. Many faults are at plate boundaries.

Earthquakes mostly occur near plate boundaries, and the majority happen around the _____ Plate. But they can happen anywhere.

Seismic Waves

Energy from earthquakes travels as _____, which spread in many directions.

Term	Meaning
	The spot on the fault, in the crust, where the plates slip past each other
	The spot on the surface above the focus, where the greatest shaking occurs

Detecting Earthquakes

A _____ is an instrument used to detect and record seismic waves. The record it makes is called a _____.

Wave	Order it arrives	Facts
Primary wave (_____)	1st	fastest but weakest
Secondary wave (_____)	2nd	slower but more powerful
_____ waves	last	travel only on the surface, slowest, cause the most damage

P and S waves together are called _____ because they travel through the interior of the Earth.

If the P and S waves are farther apart on a seismogram, the epicenter is _____ away.

Scientists need information from at least _____ seismograph stations to locate an epicenter.

Measuring and Preparing

Earthquakes are measured on _____ scales. The higher the magnitude, the more energy. Larger earthquakes are less common.

Seismic waves show Earth has a solid inner core, a _____ outer core, a semi-solid mantle, and a solid crust.

We cannot _____ earthquakes, but we can prepare with stronger buildings and emergency response plans.

Think About It

What is one thing your family could include in an earthquake emergency plan?

_____
