Unit 10: Geometry Guided Notes

Name: _____ Fill in each blank while you watch the video for that lesson.

Week 33 Day 1: Lines, Rays and Line Segments

Video: Introduction to Lines, Rays and Line Segments (Edpuzzle Original)

A _____ starts at one point and ends at another point.

A _____ starts at an endpoint and goes on forever in _____ direction.

A _____ goes on forever in _____ directions.

An _____ on the end of a drawing means it keeps going forever in that direction.

Drawing	Endpoints	Name
dot at both ends	2 endpoints	
dot at one end, arrow at the other	1 endpoint	
arrows at both ends	0 endpoints	

Week 33 Day 1: Parallel and Perpendicular Lines

Video: Parallel and Perpendicular Lines (Edpuzzle Original)

_____ lines are always the same distance apart and never _____ (cross).

We show lines are parallel with matching _____ on the lines.

_____ lines intersect to make a _____ (90 degrees).

We show a right angle with a small _____ symbol where the lines meet.

If two lines only look parallel or perpendicular but are not marked, we _____ for sure.

Week 33 Day 2: Types of Angles

Video: Angle Type Identification (Acute, Right, and Obtuse) (Edpuzzle Original)

An angle is formed when two lines, segments, or rays meet at _____.

Type of angle	Size

	exactly 90 degrees (a square corner)
	less than 90 degrees
	more than 90 degrees but less than 180 degrees

Tip: To tell what kind of angle it is, picture a _____ on top of it and compare.

Week 33 Day 3: Measuring Angles with a Protractor

Video: Identifying Angles on a Protractor (Edpuzzle Original)

Step 1: Find the arm that is lined up with the _____.
Step 2: Decide if the angle is acute or _____ to narrow down your choices.
Step 3: If the baseline arm goes through 0 on the outside numbers, read the _____ numbers. If it goes through 0 on the inside numbers, read the _____ numbers.

When we name an angle with three letters, the _____ is always the middle letter.

Example: The 35 degree angle in the video is named angle E_____H.

Week 34 Day 1: Drawing Angles

Video: Drawing Angles (Edpuzzle Original)

Draw one arm as a _____. Use the straight edge of the protractor.
Line up the _____ (center) of the protractor with the endpoint.
Line up the _____ of the protractor with the arm.
Find your angle on the correct set of numbers and make a small _____.
Connect the vertex to the mark to draw the other arm, and _____ the angle size.

To draw 72 degrees on the inside numbers, follow them to 70 and count on _____ more degrees.

Week 34 Day 2: Missing Angles

Video: Missing Angles (Edpuzzle Original)

Angles that combine to make a straight line add up to _____ degrees.

Adjacent angles that fill a right angle add up to _____ degrees.

To find a missing angle, _____ the angles you know from the whole angle.

Example: 17 + p + 25 = 90. First 17 + 25 = _____. Then 90 - 42 = _____.
So p = 48 degrees.

Week 34 Day 3: Identifying Triangles by Angle

Video: Identifying Triangles by Angle (Acute, Right, Obtuse) (Edpuzzle Original)

Type of triangle	What it has
	one right angle
	one obtuse angle
	three acute angles

Every triangle has at least _____ acute angles. The _____ angle tells you what type of triangle it is.

Week 34 Day 3: Symmetry

Video: Introduction to Symmetry (Edpuzzle Original)

A shape has _____ when it can be split in half and one side is a _____ of the other side.

The line that divides the shape into two matching halves is the _____.

A shape with no line of symmetry is called _____.

To check a line of symmetry, imagine _____ the shape on the line. Do both sides match perfectly?
