10.1 The Water Cycle

4th Grade Science · Video: The Water Cycle for Kids (Learn Bright)

Name: _____ Date: _____

Watch the video and fill in the blanks as you go.

What Is the Water Cycle?

The water on Earth is always moving and changing _____.

The water cycle is the _____ that all water follows as it moves around the Earth.

Liquid water is found in oceans, rivers, lakes, and even _____.

Solid water, or _____, is found in glaciers, snow, and at the North and South Poles.

Water vapor is a _____. It is found in Earth's atmosphere.

The Four Stages

The four stages are evaporation, transpiration, condensation, and precipitation.

Evaporation happens when the _____ heats up water in oceans, lakes, and rivers.

When water gets hot enough, it changes into a gas that goes into the air.

You can see evaporation if you leave an open _____ of water out.

Transpiration is the release of water vapor through a plant's _____.

Condensation happens when water vapor in the air becomes _____ and changes back into a liquid.

Condensation is how _____ are formed.

You can see condensation on a bathroom _____ after a hot shower.

Precipitation is rain, snow, sleet, or _____ that falls to the ground.

When clouds get too _____, it rains.

Precipitation gathers in bodies of water or underground. Then the cycle starts again.

Taking Care of Our Water

The water cycle helps keep Earth's _____ just right for plants and animals.

One of the best ways to help is to _____ water.

Turn off the _____ when you brush your teeth, and take shorter showers.

Keep water clean. No _____ in lakes, rivers, and streams.

Fresh water is only about _____ percent of all the water on Earth.

The air around Earth holds more fresh water than all the rivers put together.

Vocabulary

Word	Meaning
evaporation	when the sun heats water and it changes into a gas
transpiration	when plants give off water vapor through their leaves
condensation	when water vapor cools and changes back into a liquid
precipitation	rain, snow, sleet, or hail that falls to the ground
conserve	to save something and not waste it

Key Takeaways

• Water moves in a cycle: evaporation, transpiration, condensation, precipitation, and around again.

• We have a limited amount of fresh water, so we should _____ it and keep it clean.
